

# Living Lab Peat Rehabilitation Indonesia

International Conference Sustainability of Wetlands  
PHLB ULM Webinar Series #1 on Wetlands  
September 16, 2020

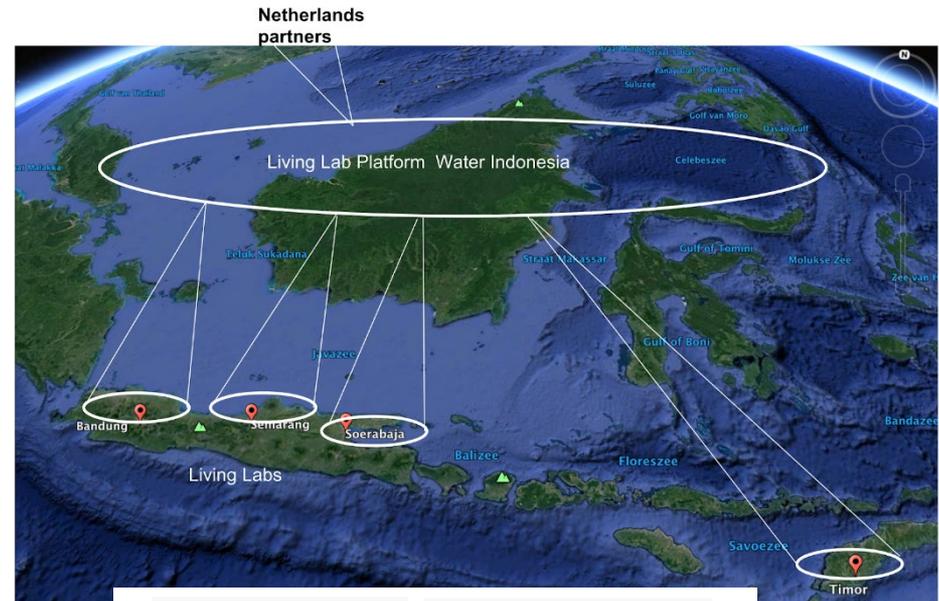

*Dr. Peter van der Meer – associate professor Oil Palm & Tropical Forests*  
[Peter.vandermeer@hvhl.nl](mailto:Peter.vandermeer@hvhl.nl)

# Introduction - Living Labs Indonesia

Indonesian and Netherlands researchers have initiated a number of so-called Living Labs to address the local and regional water related challenges

## Living Lab Platform

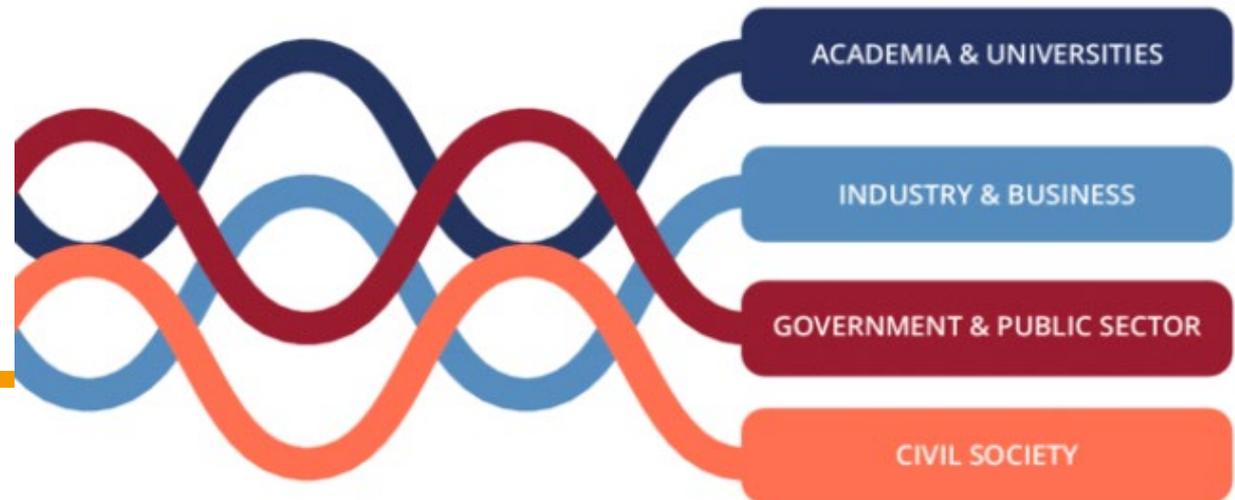

KONINKLIJKE NEDERLANDSE  
AKADEMIE VAN WETENSCHAPPEN

# Living Lab approach

Definition: “physical regions or virtual realities where stakeholders form a public-private-people-partnership of firms, public agencies, universities, institutes and users, all collaborating for creation, prototyping validating, and testing of new technologies, services, products and systems in real-life contexts” (Westerlund & Leminen 2011)

Quadruple helix

# Living Lab **Water** Indonesia – workshop 2019

*Workshop on July 11 2019, UGM, Yogyakarta:*

- To transfer ownership of the Living Lab(s) to Indonesia and the involved LLAB partners.
- Initiate /continue individual projects with local (water related) themes with a solution based approach

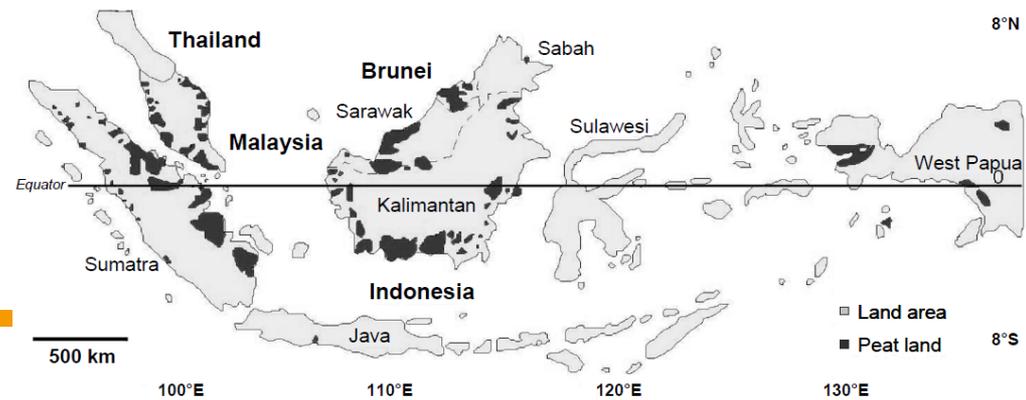

## **Living Lab Indonesia VHL initiatives:**

- Bandung – Sustainable River Mngt
- Yogyakarta - Agroforestry
- West Timor – Climate Smart Agriculture
- Kalimantan – Peat & Paludiculture
- Sulawesi – Digital Farmer Fieldschool

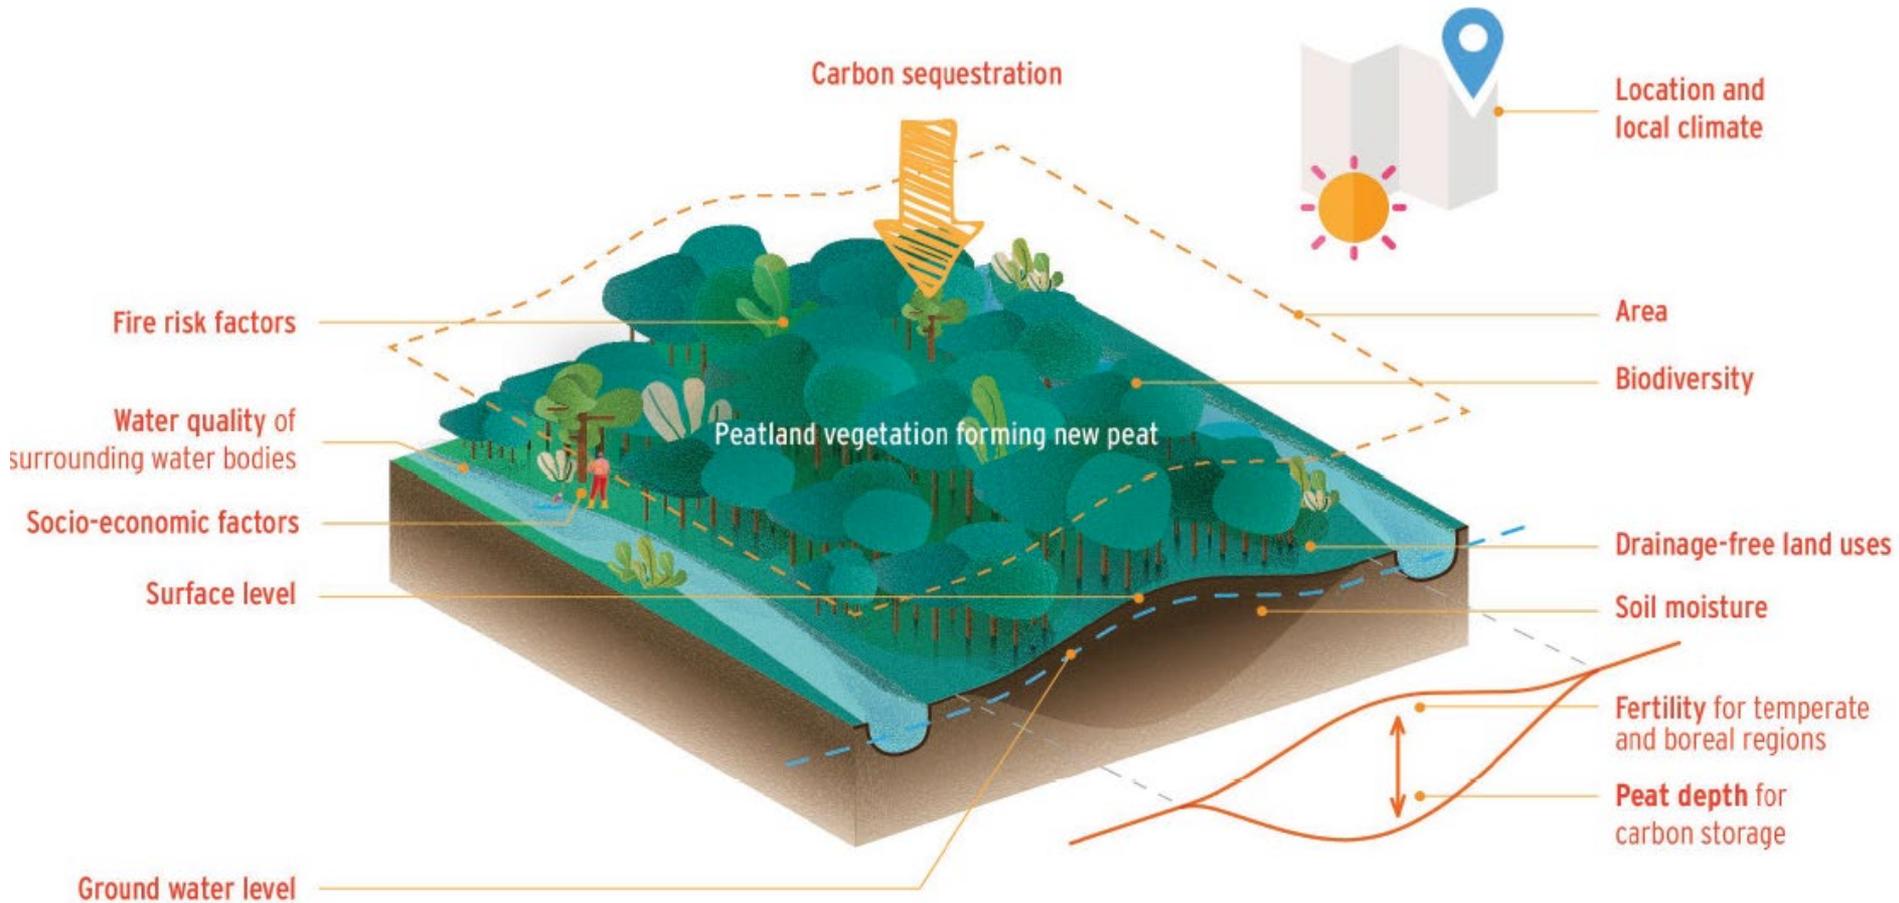

# Peatlands and Ecosystems Services: oil palm and alternatives

- Large areas of peat forest in Indonesia have been drained and cleared for the cultivation of palm oil and other agricultural crops;
- Has caused several important problems (climate change, haze, subsidence, biodiversity loss);
- Challenge -> more sustainable systems reducing the trade-off effect between economic and environmental benefits;

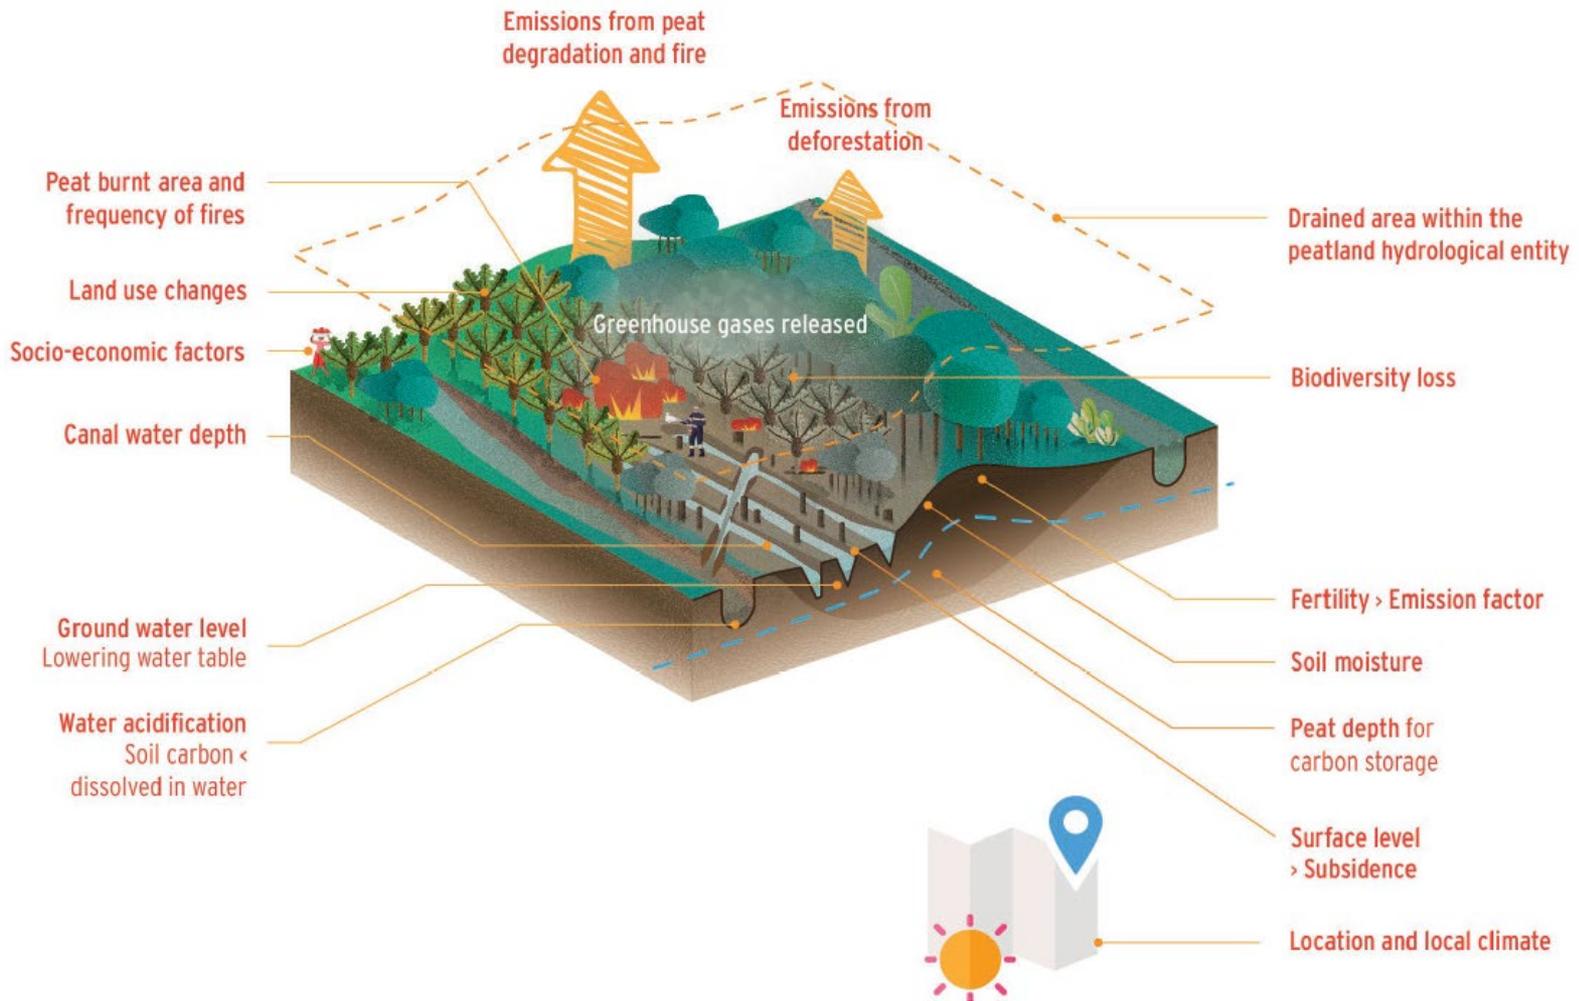

# Undisturbed Peat Forest

From FAO 2020 (Peatland Mapping & Monitoring)

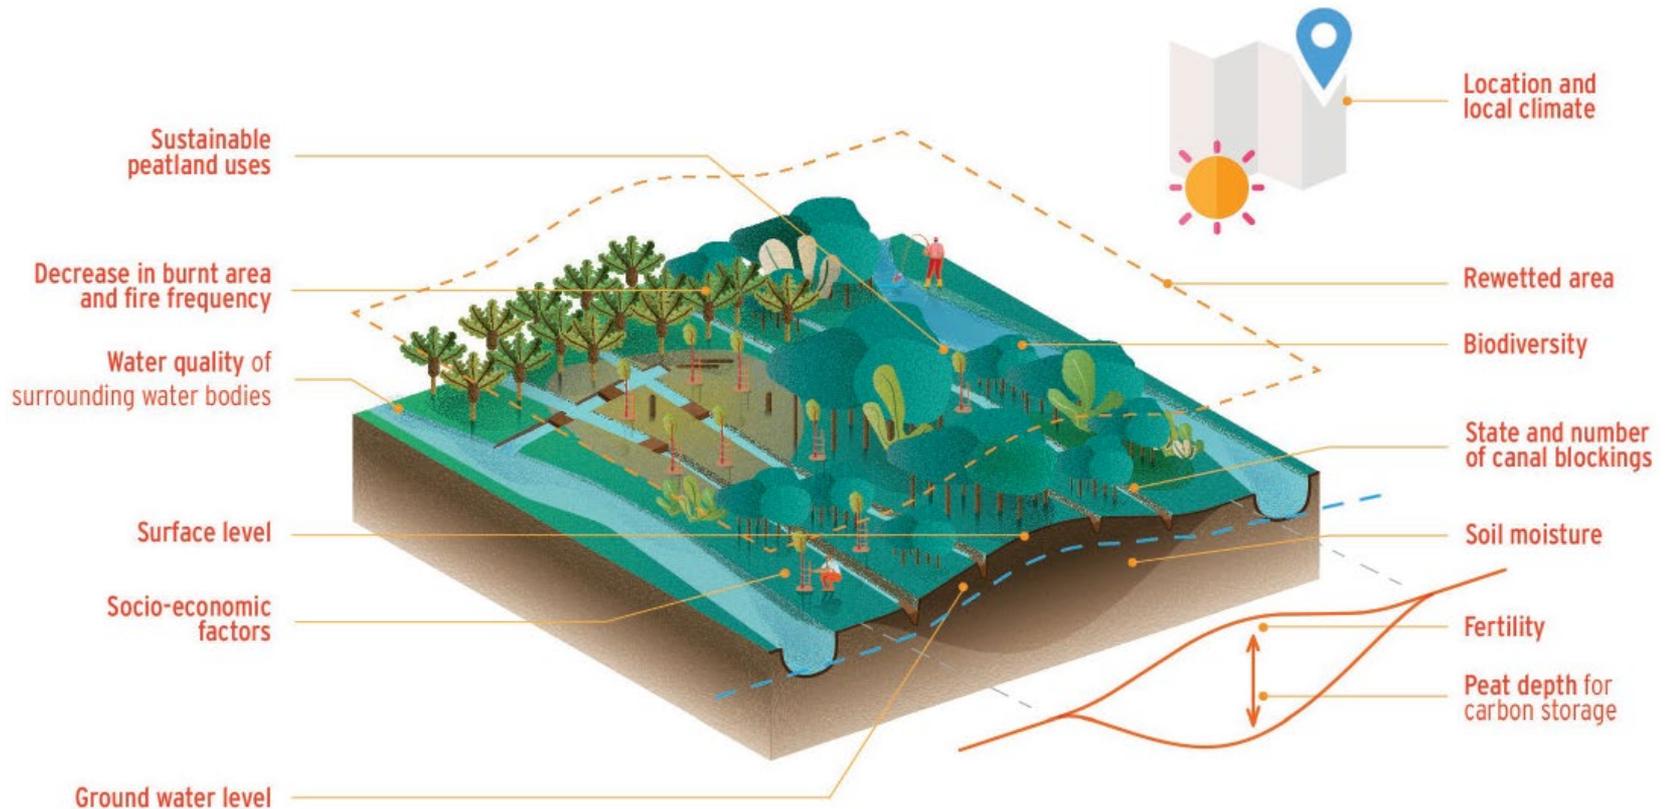

# Drained Peat Forest

From FAO 2020 (Peatland Mapping & Monitoring)

# Peat area Restoration

From FAO 2020 (Peatland Mapping & Monitoring)

# Ecosystem services analysis *(Middelberg et al 2019)*

To assess the opportunity for alternative land use systems using non-drainage species, which could eventually phase out or partly replace oil palm plantations on undrainable peat

- Species selection
- Ecosystem services
- Stakeholders interviews

Photo Maik Jerusalem

# Meta-analysis of species growing in undrained peat

## *Shortlist species cultivated by smallholders (n=37)*

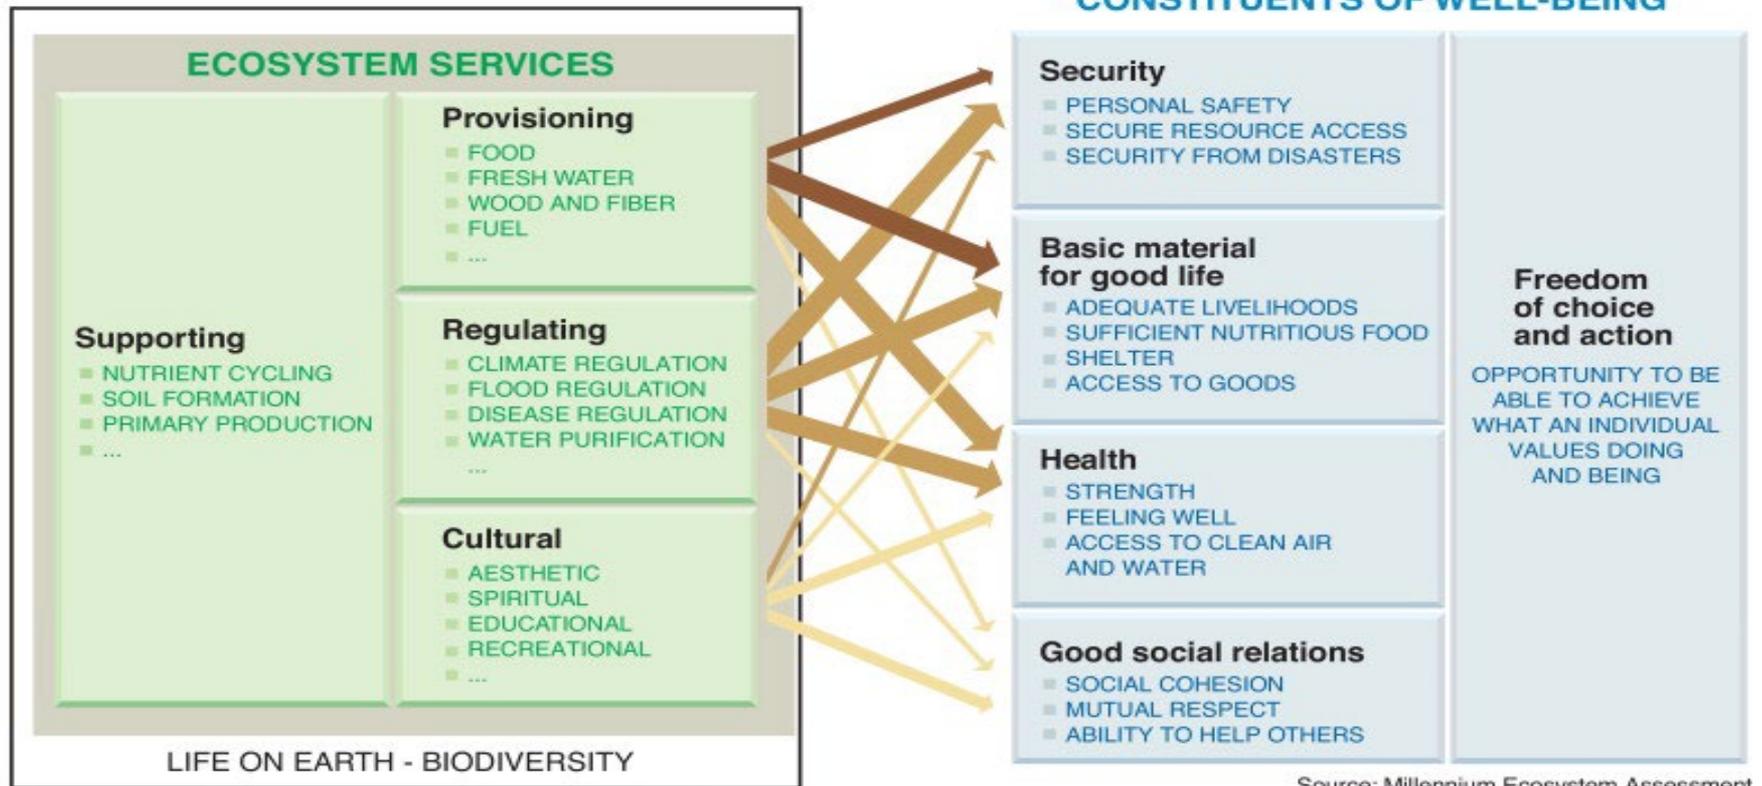

Scientific name	Vernacular and local names
<i>Aleurites moluccana</i>	Candle nut / Bua keras
<i>Syzygium aqueum</i>	Water apple, Jambu air
<i>Ipomea aquatica</i>	Kangkong
<i>Garcinia mangostana</i>	Mangosteen / Manggis
<i>Dimocarpus longan</i>	Longan / Mata kucing
<i>Nephilium lappaceum</i>	Rambutan
<i>Chloranthus erectus</i>	Keras tulang
<i>Metroxylon sago</i>	Sago / Sagu
<i>Dyera polyphylla</i>	Jelutung

## **Species short list**

- Multi criteria analysis
- 32 species
- Mostly NTFP species

# Ecosystem Services

Source: Millennium Ecosystem Assessment

**ARROW'S COLOR**  
Potential for mediation by socioeconomic factors

- Low
- Medium
- High

**ARROW'S WIDTH**  
Intensity of linkages between ecosystem services and human well-being

- Weak
- Medium
- Strong

(Fisher et al., 2013)

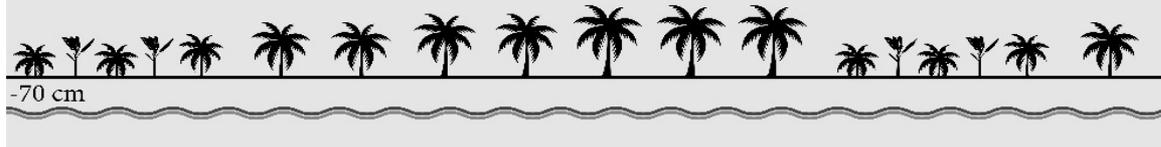

# Ecosystem Services in Oil Palm Landscapes

Ecosystem Group	Services	Indicators	Methods	Source(s)
Provisioning		Palm oil yield, crop yield, revenue	Semi-structured interviews, yield/revenue calculations	<i>Teuscher et al., 2015; Lee et al., 2014</i>
Regulating		Carbon sequestration	Vegetation measurements and allometric equations, Remote Sensing	<i>Labata et al., 2012; Morel et al., 2011; Anaya et al., 2009; Foody et al., 2008; Chave et al., 2005</i>
Supporting		Pest control, pollination, biodiversity	Measure foliar herbivory, species abundance, maximum entropy models	<i>Sumarga, 2015; Lucey et al., 2014; Luskin &amp; Potts, 2011; Fayle et al., 2010; Koh, 2008</i>

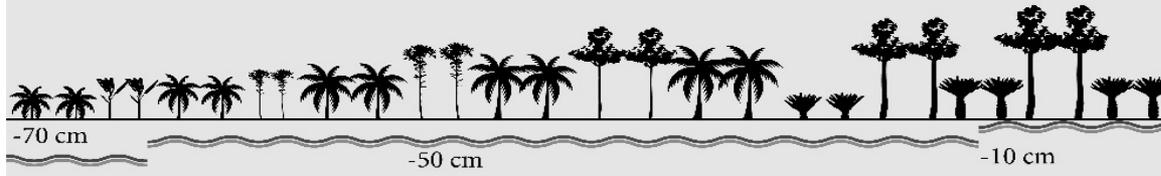

# Rewetting scenarios for phasing out Oil Palm

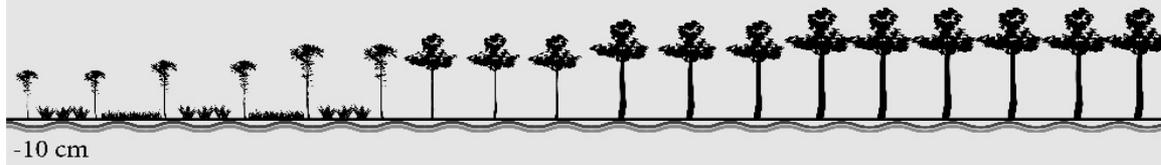

## 1. Base-line scenario oil palm

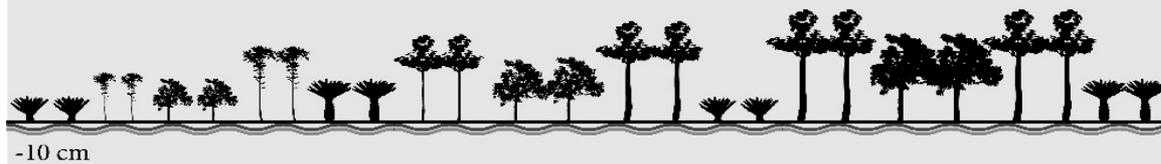

## 2. Transition from oil palm to mixed paludiculture system

## 3. Immediate change to monoculture paludiculture system

## 4. Immediate change to mixed paludiculture system

# Performance assessment of selected ecosystem services for 4 rewetting scenarios in peat

Ecosystem services	Scoring	Scenario 1	Scenario 2	Scenario 3	Scenario 4
Carbon emission	>15	18			
(conservation)	10-15		13		
	5-10			3	3
	1-4	1	2	4	4
<b>Overall performance</b>		<b>38 %</b>	<b>69%</b>	<b>75%</b>	<b>81%</b>
Assessment score					
<b>Provisioning</b>	Level of income	0-1			
Indicator assessment:	>1 commodity diversification of income	0-1	0	1	0
	Regular harvest	0-1	1	1	0,5
	Steady market	0-1	1	0,5	0
Assessment score			3	3	1
	Total assessment scores ( $\sum ni$ )		6	11	12
	Performance Assessment (%)		38%	69%	75%

Base-line scenario OP

Transition to mixed paludiculture

Immediate change to mono-paludiculture

Immediate change to mixed paludiculture

# Conclusion ecosystem services and peat rehabilitation

1. Alternative paludiculture systems can potentially yield more ecosystem services than oil palm plantations on peat;
2. The willingness of stakeholders for sustainable use of peatlands is present;
3. However, replacing oil palm (both plantations and smallholder) with alternative systems like paludiculture may not yet be realistic because of:
  - Economics : value chain, markets, economic return;
  - Technical: mixed versus mono-culture, access of water-logged land;
  - Governance: incentives, land tenure

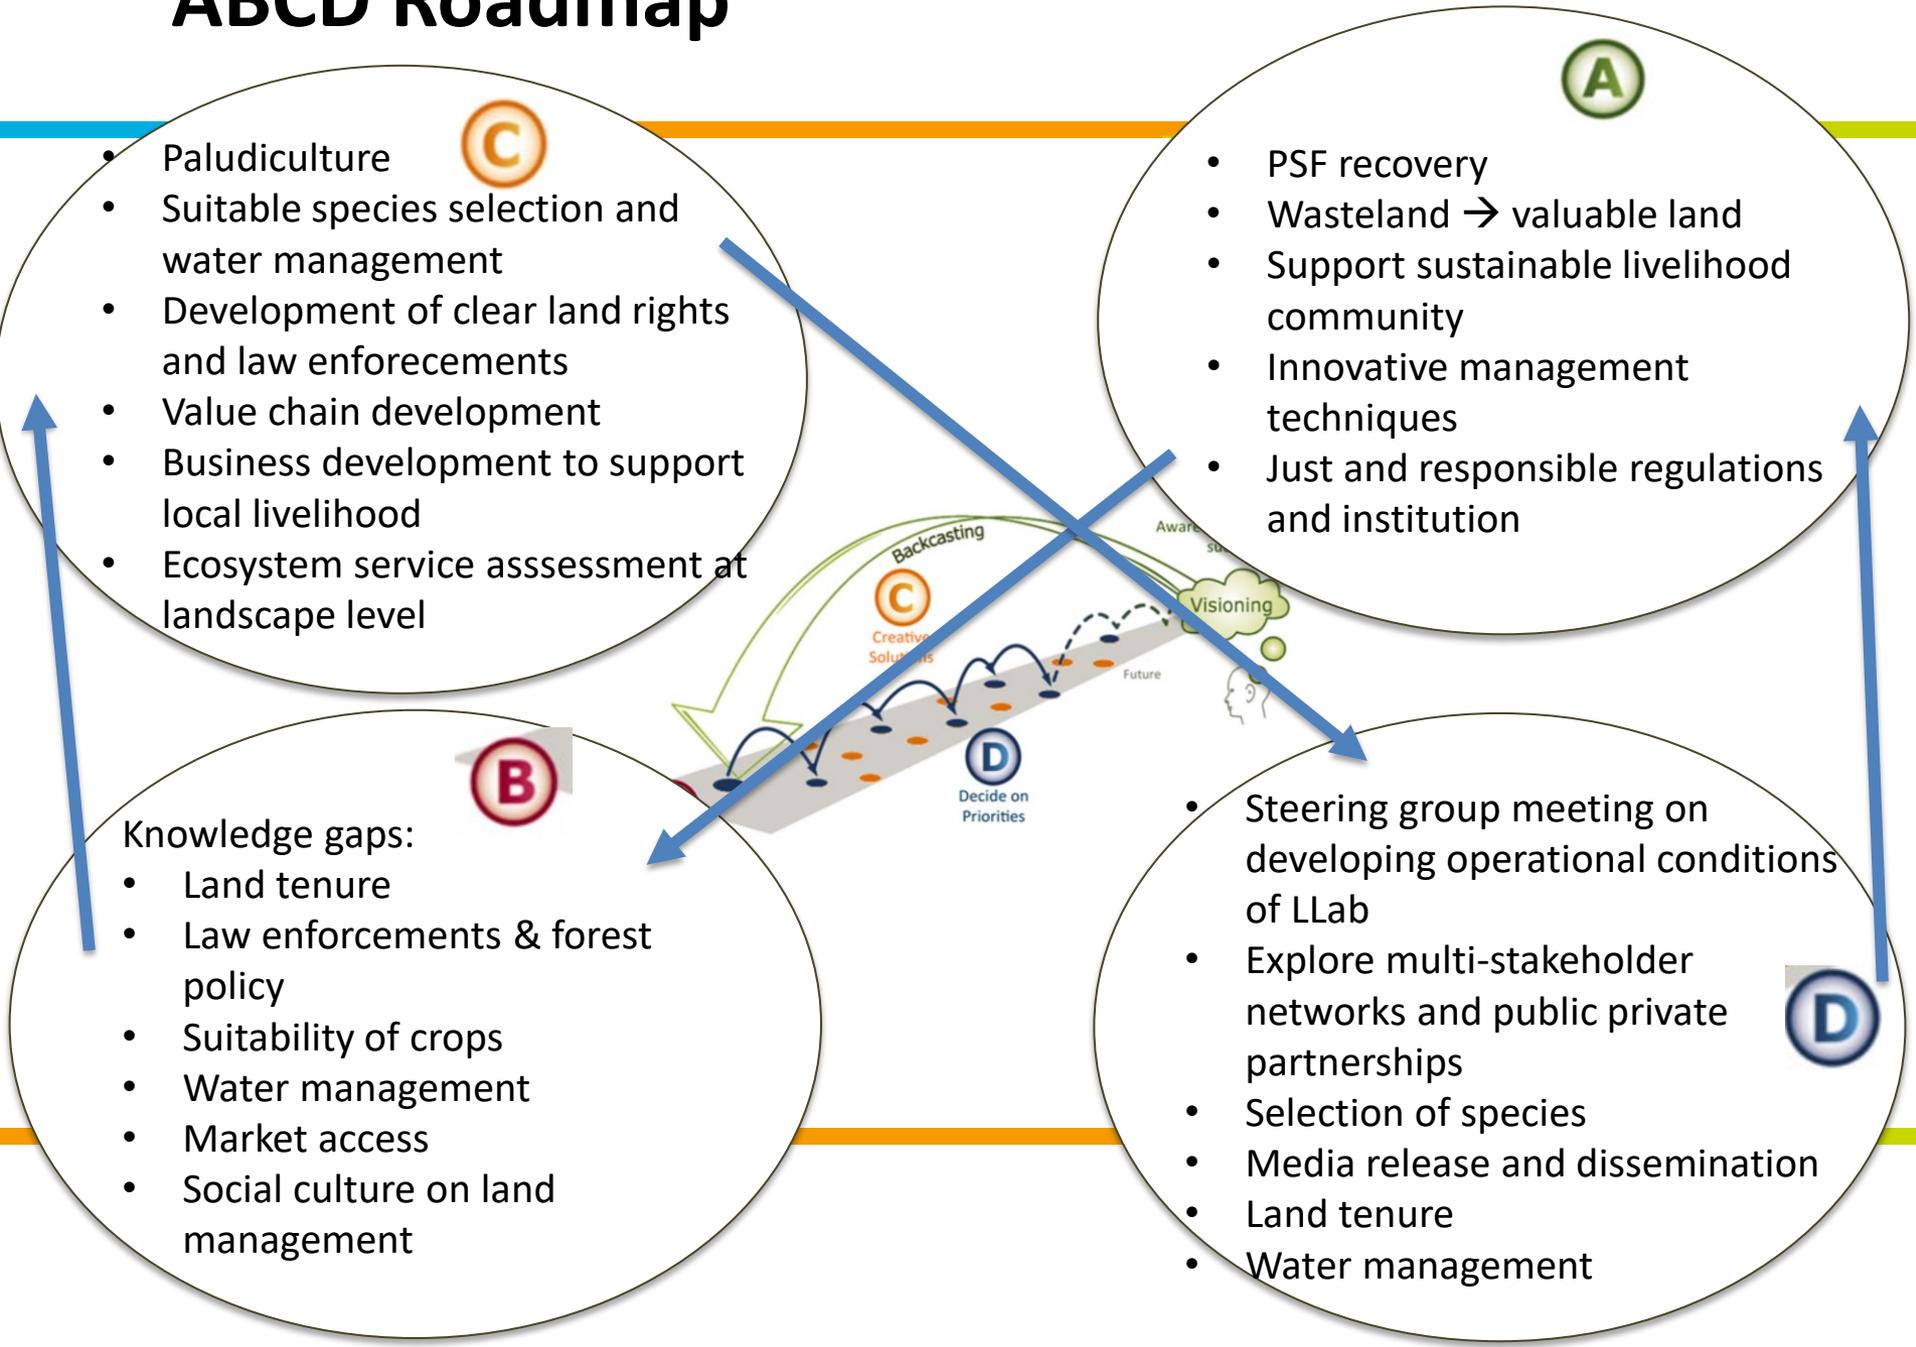

# Workshop Banjarbaru, Kalimantan (July 2019)

**Vision:** Degraded peatlands in Kalimantan & Sumatra are restored providing valuable ecosystem services for people, the economy and the environment through collaboration of stakeholders, embedded in just and responsible institutions

- **Target groups:** KPH's & other Govt agencies, local communities, private parties, NGO's
- **Potential Locations:** Kalimantan (Tumbang Nusa, Hutan Lindung Banjarbaru) Sumatra (Jambi area)

# ABCD Roadmap

# Living Lab Peat Rehabilitation – results so far

- Workshop July 2019
- Various student studies:
  - Value chain study Sago (MSc thesis)
  - Inventory paludiculture crops (BSc-thesis)
- Funding opportunities (2 proposals)
- Large groups of (potential) stakeholders identified

IMPROVING SAGO VALUE CHAIN FOR INDONESIA AND EU MARKET. A CASE STUDY OF KAPUAS DISTRICT IN CENTRAL KALIMANTAN, INDONESIA

Akalugwu Chinyere

# Living Lab Peat Rehabilitation – looking forward

- Further development of the Living lab approach:
  - short term project activities vs longterm partnerships
  - implications for education at associated universities
  - Involvement of private industries (including Oil Palm companies)
- Explore multi-stakeholder networks and public private partnerships
- Setting up paludiculture trials for testing

# Terimah Kasih
